Electionware incorporates the very latest in election security, including heightened audit controls and built in change management processes that ensure election data is safe and secure.

**SYSTEM SECURITY**

- The Election Management System running Electionware is a hardened server; configured to include only the services, applications, utilities and settings required to successfully operate the system. The hardening process turns the server into a single-use device, dedicated solely to creating and operating elections.
- Electionware is protected by two-factor authentication using Windows BitLocker.
- Electionware requires usernames and passwords to launch the EMS application. The restricted user roles segregate which features are accessible.
- The database server accesses data through a dedicated hardened EMS client on an air-gapped monitored network.

**PHYSICAL ACCESS CONTROLS**

- Officials are required to implement a strong physical and procedural security plan that limits access to Electionware to authorized personnel only.

**AUDIT LOGS**

- Electionware saves a record of all user actions with usernames to the system audit log. Electionware maintains an audit log that shows all system processes. This audit log can be filtered by date and type of event.
- The log can be printed, or saved in a variety of file formats, including .pdf, .rtf, .html, .xls, and .csv. The log operates during all processes, including results processing. Optionally, log events can be viewed in real-time in the output window, which displays errors in red text, warnings in blue text, and normal events in black text.
- Audit records created during the election definition and ballot preparation include records for all steps in the finalization of the ballot layout. These records are date/time stamped, include a description of the action and the module in which the action occurred. Audit reports can be filtered by date, event type, and sorted by ascending or descending timestamps.
- Audit logs on the EMS server either in Electionware or the database cannot be modified.
IS A PAPER BALLOT CARD AUDITABLE?
Yes. Just as hand-marked paper ballots can be inspected or audited by hand or by machine, so can paper ballot cards since they contain both human-readable selections and corresponding machine-readable barcodes. The ballot card contains the same data as a hand-marked ballot, displayed in different ways. During a post-election hand-count audit, selected candidate names are used to count the vote.

ES&S fully supports the use of paper ballots and post-election audits as a way to ensure accuracy and increase confidence in our country’s election process.

- Electionware offers election officials the ability to conduct a wide range of post-election audits with improved effectiveness and efficiency. The system provides easy-to-read, side-by-side comparisons of the unaltered ballot image and its corresponding cast vote record, making it possible to audit any election in a fraction of the time.

- Electionware provides an export of cast vote records that are easily imported into the various risk-limiting audit systems in use today.

Post-election Auditing with Electionware
ES&S fully supports the use of paper ballots and post-election audits as a way to ensure accuracy and increase confidence in our country’s election process.

- Electionware offers election officials the ability to conduct a wide range of post-election audits with improved effectiveness and efficiency. The system provides easy-to-read, side-by-side comparisons of the unaltered ballot image and its corresponding cast vote record, making it possible to audit any election in a fraction of the time.

IS A PAPER BALLOT CARD AUDITABLE?
Yes. Just as hand-marked paper ballots can be inspected or audited by hand or by machine, so can paper ballot cards since they contain both human-readable selections and corresponding machine-readable barcodes. The ballot card contains the same data as a hand-marked ballot, displayed in different ways. During a post-election hand-count audit, selected candidate names are used to count the vote.

ES&S Security Philosophy
Nothing is more important to ES&S than protecting America’s democracy through secure and accurate elections. That’s why every ES&S product reflects the company’s three-part security philosophy:

- **Design**: All products are designed, without compromise, to meet the latest and ever-evolving standards in security, accuracy and reliability.

- **Testing**: In addition to ES&S testing protocols, all tabulation systems are rigorously tested and certified by the federal Election Assistance Commission (EAC), which reflects security and performance standards developed by scientists, academia and election officials. The ES&S testing protocol also involves testing by independent, accredited laboratories. ES&S submitted our end-to-end voting configuration for Cybersecurity and Infrastructure Security Agency (CISA) critical product evaluation (CPE) at Idaho National Labs.

- **Implementation**: The entire ES&S team is devoted to ensuring that each piece of technology performs as expected on election day, helping election officials uphold the laws of their state which mandate strict physical security and tight chain of custody of all voting machines.

Perhaps most importantly, ES&S’ essence — its very being — is predicated on providing America with secure, accurate and accessible elections. Every person at ES&S holds themselves, and each other, accountable for this mandate, and is proud to serve a role in this noble purpose.
